
Mesengenic AI
A Target-Agnostic Generative Agent

Problem

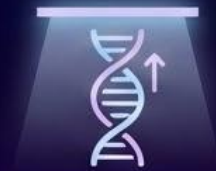

Finding not Founding

- Magnifying glasses rather than pens
- *Big Pharma spends $2.6 Billion per drug trying to **find** "Biosimilar" molecules*
  - *The Mutational Debt*
- Intent is decoupled from execution
- *Synthesis hardware sits idle as human intuition can only "**discover**" at the speed of a lab bench*
  - *Hardware Software Gap*
  - *$250 Billion Patent Cliff*

Ceiling Rather than The Floor

- Nature is Exhaustive
- *The solutions to new to nature functions lies in the latent space*
- A better shovel is still a shovel

Discovery, Friction, R&D waste

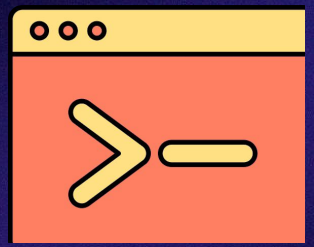

- High Throughput Screening
- Fragmentation
  - Identification, Design, Structural Prediction, Physics Validation, Synthesis

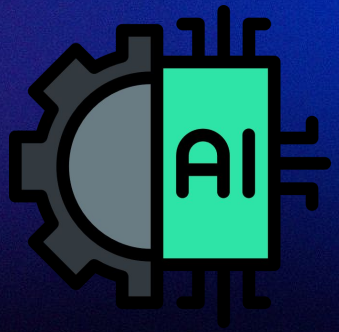

Solution: What we offer

The Mesengenic OS: The Intelligence Layer for Biology

The Mesengenic Suite (Terminal + Lambda): A natural language interface for labs

Connect API + Radar/Sisyphus validation: high-confidence designs for partners and printability for users

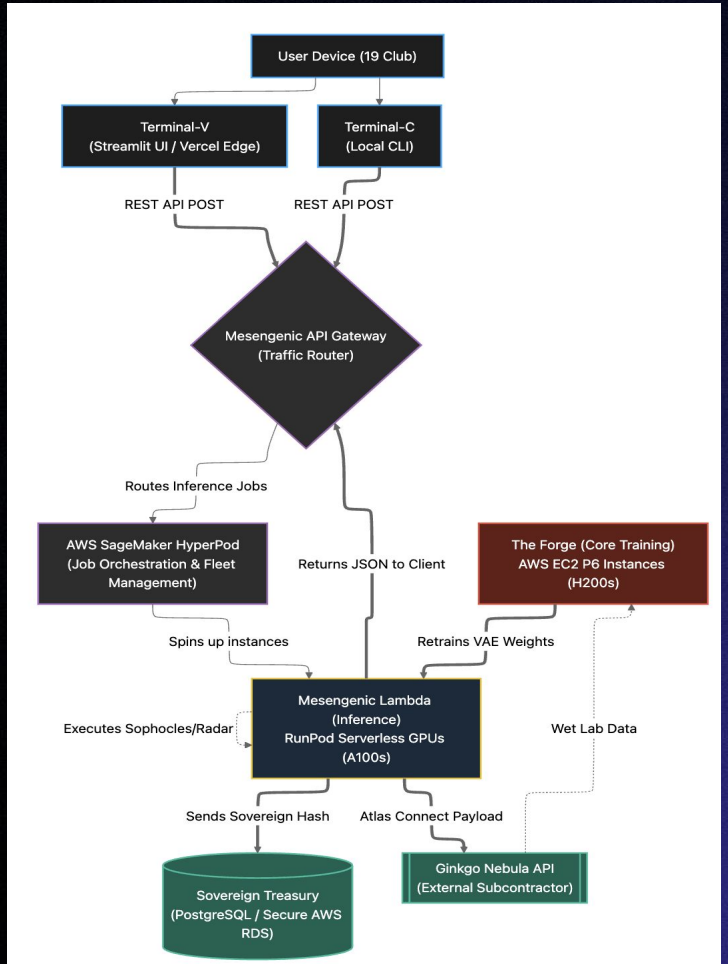

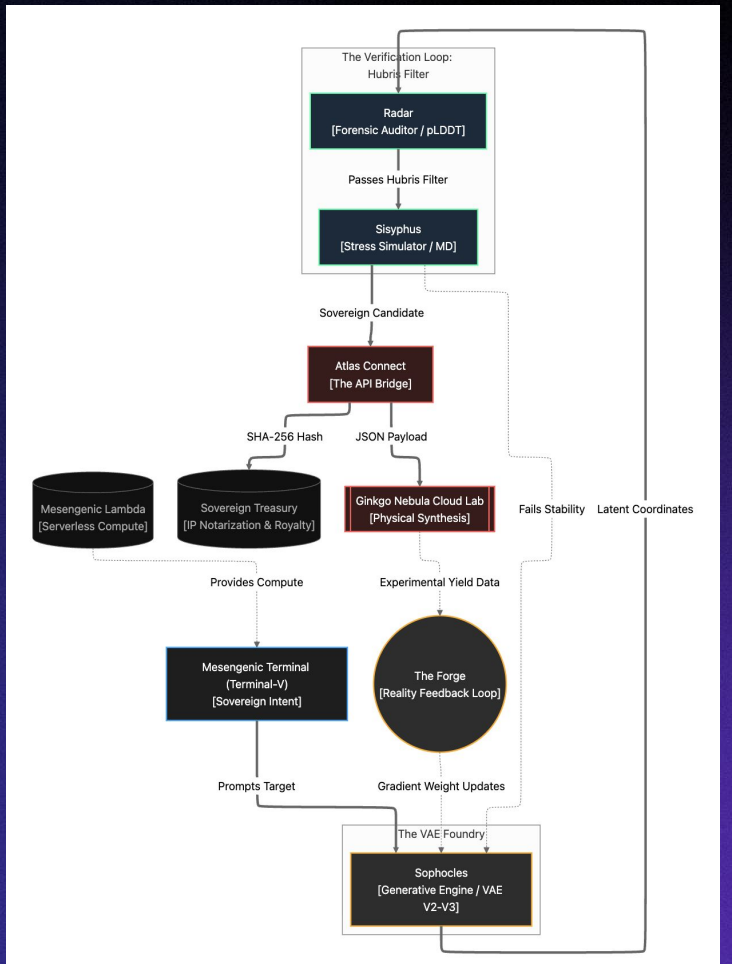

Mesengenic Treasury: Latent IP Notarization 20% Sovereign Royalty

We are not a tool. We are the operating system for the 21st-century bio-economy.

Feed the hardware. Fortify the pipeline. Fund the future.

The Solution - An Integrated Intelligence Pipeline - MIS

Mesengenic AI

Market Analysis

Impact

From faster protein decisions to faster therapeutic possibilities

Responsible by design

- **Public-data only:** MaveDB, UniProtKB, Pfam/InterPro. No patient data.
- **Decision support, not autopilot:** The model prioritises. The scientist decides.
- **Confidence before action:** Candidates are ranked and filtered before wet-lab spend.

Research and industry impact

- **$4,499.86 saved per candidate:** $0.14 cloud validation vs. $4,500 wet-lab assay
- **$10^9 \rightarrow 1{,}000$:** From huge search space to a high-priority shortlist
- **3 min 47 sec vs. months of iteration:** Faster triage before expensive experimentation

Clinical and research impact

- **Stronger candidate selection in high-need areas:** AMR, cancer pathways, gene therapy, and autoimmune targets
- **Earlier focus on promising biology:** More time spent on viable candidates, less on experimental dead ends
- **A stronger bridge from model output to wet-lab follow-up:** Helping researchers move from sequence generation to testable next steps

Competitive landscape

The New Alpha: From Prediction to Sovereignty

AlphaFold 3 / Chai-1

Capability: Structural Prediction: “How does this sequence fold?”

Primary Logic: Static: Relies on known PDB structures (The Past).

Data Basis: Zero. A research tool, not a legal shield.

IP Handling: A digital coordinate map.

The Outcome:

Cradle-1 / Xaira

Capability: Property Optimization: “Make this 10% more stable.”

Primary Logic: Wet-Lab Iterative: Requires 96-well plate data to start.

Data Basis: Traditional. Slow, manual legal filings.

IP Handling: An optimized lab candidate.

The Outcome:

Mesengenic AI

Capability: Generative Evasion: “Find a viable variant patents missed.”

Primary Logic: Evolutionary: Uses Manifold Density Priors (Potential).

Data Basis: Native. Integrated Sovereign Treasury (Instant ID).

IP Handling: A Sovereign Asset.

The Outcome:

Thank you!
